Chapter 1. About the Wwise Cube Integration

Audiokinetic integrated the Wwise sound engine into a non-violent adaptation of the open-source first-person game Cube. This version features the same Wwise Wwizard seen in the Wwise Adventure Game sample.

The Cube Integration was created to help you better understand how to integrate the Wwise sound engine into your game and to provide a functional game for sound designers to experiment with Wwise. This game was chosen as an example for the simplicity of its structure and because it is relatively easy to modify, if needed.

This document is divided into the following main sections:

- [Chapter 2, *Installing and Running the Cube Demo*](#)—Shows you how to install and run the Cube Demo on both Mac® and Windows, with and without the Audiokinetic Launcher.
- [Chapter 3, *Understanding the Sound Engine Integration into Cube*](#)—Shows you how the Wwise sound engine was integrated into Cube.
- [Chapter 4, *Understanding the Wwise Project*](#)—Explains the design decisions made in the Wwise project.
- [Chapter 5, *Modifying the Sound Design*](#)—Shows you how to fine-tune sound properties in real time and how to integrate those changes using newly generated SoundBanks.

Chapter 2. Installing and Running the Cube Demo

The Cube Demo package includes the following components:

- Debug, profile, and release versions of Audiokinetic's Cube game.
- The Wwise project that was used to modify and add sounds to the game.
- The Cube game engine source code and documentation.

Note

Materials sent by content providers were all originally high quality (48 kHz, 16 or 24 bits). However, to save download time and disk space, the size of some of the sound assets has been reduced.

Refer to the following sections for details on installing and running the Cube Demo.

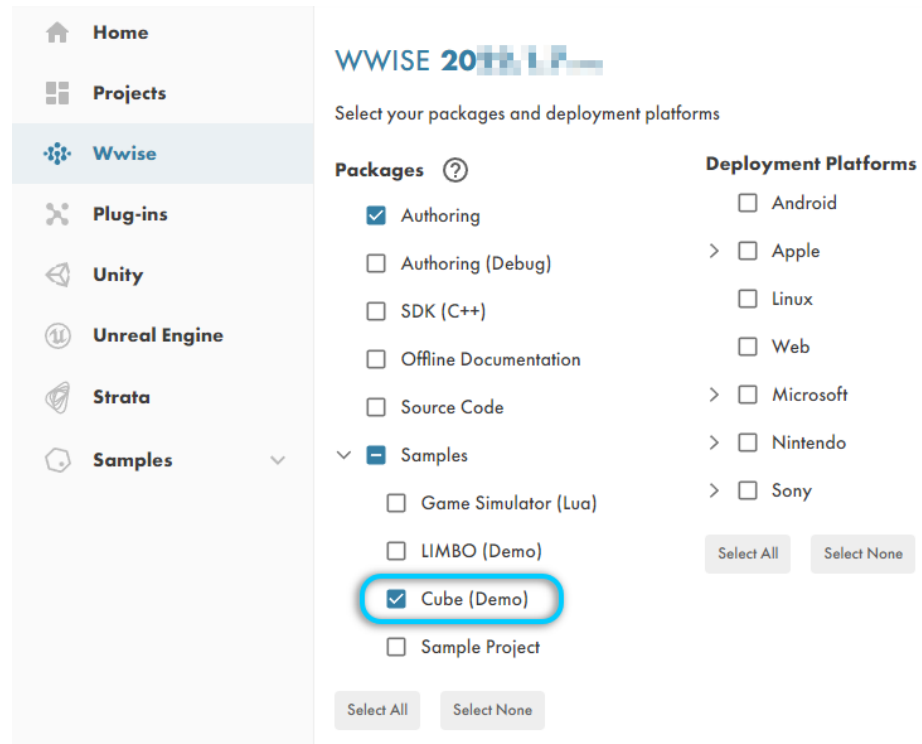

Installing the Cube Demo

The Cube Demo is installed using the Audiokinetic Launcher.

To install the Cube Demo:

- While you are [installing Wwise](#) (or modifying an existing installation), expand the **Samples** menu and select **Cube (Demo)**.

To modify an existing Wwise installation, on the Wwise page of the Launcher, select the wrench button to the right of the installation and click **Modify**.

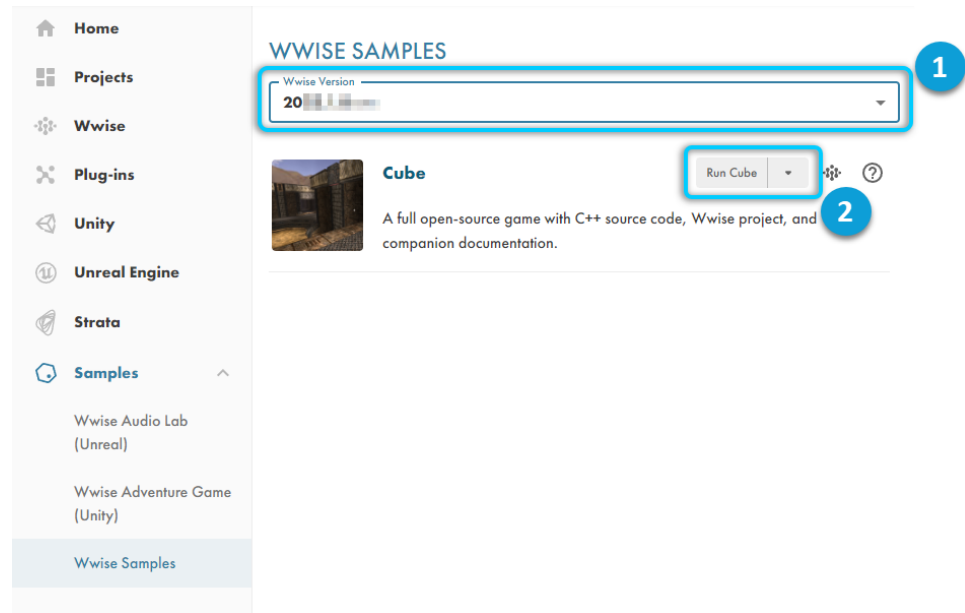

Running the Cube Demo from the Launcher

After you install the Cube Demo, it is listed on the Samples > Wwise Samples page of the Launcher.

To run the Cube Demo:

1. On the Samples > Wwise Samples page, select the version of Wwise for which you installed the Cube Demo.
2. Click **Run Cube** to start the game.

Running the Cube Demo without the Launcher

For various reasons, you might prefer to run the Cube Demo without the Launcher. There are alternative methods, with some differences depending on whether they're run on Mac or Windows.

On Mac OS X

Note

Before you begin, make sure you install the Wwise SDK for Mac by selecting **SDK (C++)** and **macOS** during the Wwise installation. To add these options to an existing Wwise installation, on the Wwise page of the Launcher, select the wrench button to the right of the installation and click **Modify**.

Select your packages and deployment platforms

Packages ?	Deployment Platforms
<input checked="" type="checkbox"/> Authoring	<input type="checkbox"/> Android
<input type="checkbox"/> Authoring (Debug)	▼ <input checked="" type="checkbox"/> Apple
<input checked="" type="checkbox"/> SDK (C++)	<input type="checkbox"/> iOS
<input type="checkbox"/> Offline Documentation	<input type="checkbox"/> tvOS
<input type="checkbox"/> Source Code	<input checked="" type="checkbox"/> macOS
▼ <input checked="" type="checkbox"/> Samples	<input type="checkbox"/> Linux
<input type="checkbox"/> Game Simulator (Lua)	<input type="checkbox"/> Web
<input type="checkbox"/> LIMBO (Demo)	> <input type="checkbox"/> Microsoft
<input checked="" type="checkbox"/> Cube (Demo)	> <input type="checkbox"/> Nintendo
<input type="checkbox"/> Sample Project	> <input type="checkbox"/> Sony

1. Method 1: Use the shell scripts.
 - a. Make sure the unzipped Cube Demo folder shares the same parent folder as the installed Wwise SDK Mac distribution. For example, if the Wwise SDK folder is `${HOME}/Wwise/wwise_${version_tag}/SDK`, then the Cube Demo root folder must be `${HOME}/Wwise/wwise_${version_tag}/CubeDemo`.
 - b. Locate the executable shell script in: `$Applications/Audiokinetic/<Wwise_version>/Cube/Mac/<mode>/bin/RunCubeDemo.sh`, where "`<mode>`" corresponds to the appropriate mode folder, either Debug, Profile, or Release.
 - c. If the `.sh` files are configured to be opened by Terminal, double-click them in Finder. Otherwise, open Terminal in the directory of the shell script, then type `RunCubeDemo.sh` and press **Enter**.
2. Method 2: Run under Xcode.
 - a. Check that Xcode is installed. If Xcode is not present in the Applications folder, download and install it from the Mac App Store.
 - b. Make sure the unzipped Cube Demo folder shares the same parent folder as the installed Wwise SDK macOS distribution. For example, if the Wwise SDK folder is `${HOME}/Wwise/wwise_${version_tag}/SDK`, then the Cube Demo root folder must be `${HOME}/Wwise/wwise_${version_tag}/CubeDemo`.

- c. In Xcode, open the following Xcode project: /path/to/CubeDemo/cube_source/src/Mac/CubeMac.xcodeproj.
- d. Build and run the project.

On Windows

1. Method 1: Use the BAT scripts.
 - a. When you installed the Cube Demo using the Audiokinetic Launcher, BAT files were created in the "<WwiseRoot>\Cube\cube" folder. Open this folder in File Explorer.
 - b. Double-click the BAT file of the Cube Demo version you want to run: debug, profiler, or release mode. Alternatively, open a Command Prompt window and type the path to the BAT file and press **Enter**.
2. Method 2: Run the executable from the Command Prompt.
 - a. Navigate to the executable, "cube.exe", and run it. It can be found under "<WwiseRoot>\Cube\Win32\<mode>\bin" where "<mode>" corresponds to the appropriate mode folder, either Debug, Profile, or Release.

Chapter 3. Understanding the Sound Engine Integration into Cube

The following tasks were involved when integrating the Wwise sound engine into Cube:

- [Preparing Cube for Wwise](#)
- [Registering Game Objects](#)
- [Integrating Audio](#)
- [Adding New Scripting Commands](#)

Preparing Cube for Wwise

Cube, originally developed by Wouter van Oortmerssen, is an open-source single or multi-player first person shooter game that is readily available from the Cube web site (<http://cube.sourceforge.net/>). To accommodate the integration of Wwise, the following modifications were made to the version downloaded from the Cube website:

- The existing sound code was rewritten to use the Wwise sound engine.
- The audio content was moved into a Wwise project.
- Dependencies on other libraries (SDL, SDL_image, libpng) were removed.
- Extra audio (footsteps, for example) was added.
- Some game config and content files were modified to accommodate the above changes.

Registering Game Objects

Two kinds of game objects were registered in the sound engine:

- Pointers to the baseent struct. These are the moving entities of the game world: players, monsters, and projectiles.
- Dummy game objects, numbered 64-127. These are used for 3D sounds that are not attached to a moving entity (for example, items spawning).

Integrating Audio

The core of the audio integration code is located in the `<WwiseRoot>\Cube\cube_source\src` folder in the following files:

- `Sound.cpp`—includes all code that accesses the sound engine.
- Sound section of `Protos.h`—includes the declared public functions.

The following types of sounds were involved in the integration process:

- **Monster Play Sounds:**

- Each character has associated pain, die, and footstep events. (See `monstertypes[]` in `monster.cpp`.)
- Footstep events are posted from the `monsterfootstep()` function, which also sets the 'Material' Switch corresponding to the texture underneath the character to drive the footstep Switch Container.
- Items have associated pickup events. (See `itemstats[]` in `entities.cpp`)
- **Magic Sounds:**
 - Each type of magic has an associated event. (See `guns[]` in `weapon.cpp`)
 - Projectiles have a splashing event (`S_FEXPLODE`, `S_RLHIT`).
 - Throwing ice gems while quad damage is enabled also posts the event `S_ITEMPUP`.
- **Network Sounds:**
 - Certain events also need to go to the server for network play; this is handled by `snd_clientevent()`.
- **Miscellaneous Sounds:**
 - To find all other sound events occurring during game play, search for `snd_event()` calls in the code base.

Adding New Scripting Commands

The following new sound-related commands were created to help you manage the sounds. These can be used in the `.cfg` script files:

- `akevent <string>`: post an event (by name) on the local player game object (`player1`).
- `soundvol <int>`: to set the sound volume (0-255).
- `musicvol <int>`: to set the music volume (0-255).
- `voicevol <int>`: to set the voice volume (0-255).
- `texturematerial <int> <string1> <string2>`: this is essentially the same command as 'texture', but with an added parameter which is the associated material for footsteps.

Chapter 4. Understanding the Wwise Project

A Wwise project was created to facilitate the integration of the Wwise sound engine into Cube. Most of the sounds in the Audiokinetic version of Cube have been modified from the original game.

Note

The Wwise project file is located in the following folder:
<WwiseRoot>\Cube\WwiseProject.

The following sections describe some of the design decisions made in the Wwise project.

Building the Actor-Mixer Hierarchy

The Actor-Mixer Hierarchy is where sound assets are organized in the project.

For the Cube project, the following audio structure was created:

- In the "Main" folder, four actor-mixers were created to group sounds into logical categories: Items, Magic, Main Characters, and Monsters.
- Within the actor-mixers, a series of Random Containers and Switch Containers were used to add variety and distinctiveness to the sounds in the project.
- Randomizers were applied to the volume and pitch properties for some magic and footsteps. The Randomizer randomly modifies the property values of the object each time it is played.
- All sounds within the "Main" folder are 3D sounds that use game-defined positioning with a standard distance-based attenuation on volume.
- In the "Maps" folder, there are sounds, voices, and music specifically related to the map "dcp_the_core". All voices and music within this map are 2D sounds that are streamed from the hard drive.

Building the Master-Mixer Hierarchy

The Master-Mixer Hierarchy is a separate hierarchical structure of busses and auxiliary busses that allows you to group the many different sound and music structures within your project and prepare them for output.

For the Cube project, the following bus structure was created:

- Three main control busses were created: Music, SFX, and Voice.

- The Environments bus groups a series of auxiliary busses. Each auxiliary bus has a reverb effect inserted that represents a room in the game. Which auxiliary bus is processing at runtime is decided in the game's code.
- Auto-ducking was applied to the Voice bus so that Music is ducked when a Voice is played.
- An RTPC was applied to the Volume property of the three main control busses. These volume controls were mapped to the in-game volume faders (using game console).

Using Game Syncs

In Wwise, game syncs are used to efficiently manage specific changes in audio that relate to changes in action or conditions within the game. In the Cube project, the following game syncs were used:

- **Switches** - A switch group called "Material" was created to manage the different ground textures that exist in the game. Switches were created within this group for each ground texture, such as concrete and grass. These switches are used to define different footstep sounds for the main character as the surfaces change within the game.
- **Game Parameters** - Three game parameters were created that correspond to the volume faders within the Cube game. These game parameters were mapped to the bus volume property of the three main busses using an RTPC. By mapping the faders to the volume properties, game players can control the volume of sounds and music in the game themselves.

The game parameter "PlayerHealth" is attached the player's health gauge in game. No sounds use it by default. You can attach this game parameter to sound object properties.

The Teleport looping Synth One sound uses the game parameter "Distance_to_Object" on the "Base Frequency" parameter of the synth to create an interesting pitch bend effect as you approach the teleporter. This game parameter can be reused on other sound objects.

Creating Events

Wwise uses events to drive the sound, music, and dialogue in-game. Events contain one or more actions that are applied to the different sound or music structures within your project hierarchy. For the Cube project, events were created and given names that matched the sound names triggered by Cube.

Understanding SoundBanks

SoundBanks are the product of all your work and are the final audio package that becomes part of your game. They contain a group of events, Wwise objects, and/or converted audio files that will be loaded into a game's platform memory at a particular point in the game. For the Cube project, the following two SoundBanks were created:

- **Main** - Groups all events used in all maps.
- **dcp_the_core** - Groups the events for the map "dcp_the_core".

Chapter 5. Modifying the Sound Design

The following sections describe how you can fine-tune the audio in real time and then integrate these changes into the game.

Fine-Tuning your Audio in Real Time in Game

After connecting to the Cube game, you can fine-tune your audio by modifying the properties for each sound in real time as the game is being played.

Note

Refer to [Connecting to a Local/Remote Game System](#) in the Wwise Help to learn how to connect the Wwise Authoring application to the game.

To modify sound properties in real-time (after connecting Wwise to the game):

1. In Cube, left-click to throw the ice gem to listen to its current sound.
2. In Wwise, select the IceGem_Blast sound object to load it into the Property Editor and Transport Control.

The IceGem_Blast sound object is located under the Magic actor-mixer in the Main folder.

3. Modify the volume and pitch properties of the IceGem_Blast sound.
4. Click Play to listen to the new sound.
5. Go back to Cube and throw the ice gem again.

You will notice that the new sound is automatically played in the game.

6. Experiment with other sounds in your game to see how quickly and easily you can fine-tune your game audio.

Integrating Changes into the Game

Although you can hear the changes you make while connected to the game, these changes are only temporary. To integrate these changes into your game, you must regenerate and replace the existing SoundBanks. After the SoundBanks have been replaced, the new sounds will be integrated into the Cube game.

Note

Make sure to close Cube before generating the new SoundBanks. When the game is running, one or more of the SoundBanks might be locked by the game preventing you from properly overwriting the SoundBank on the disk.

To generate new SoundBanks for Cube:

1. Switch to the SoundBank layout by doing one of the following:

- From the menu bar, click **Layouts > SoundBank**.
- Press F7.

Notice that you have two SoundBanks for this project: DCP_the_core and Main.

2. From the SoundBanks list, click **Select All**.
3. From the Platforms list, select the **Windows** or **Mac** option depending on the operating system you work on.
4. From the Languages list, select the **English (US)** option.
5. From the menu bar, click **Project > Project Settings**.

The Project Settings dialog box opens.

6. Switch to the **SoundBanks** tab.
7. In the Post-Generation Step group box, make sure that there is a command line for copying the streamed files in your project to the location where the SoundBanks are saved. By default, all projects have this command line as a post-generation step.
8. Click **OK** to close the Project Settings dialog box.
9. Click **Generate Checked** to begin generating the SoundBanks.

The Generating SoundBanks dialog box opens where you can view the progress of the SoundBank generation process. When the SoundBanks have been generated, the SoundBanks Generation - Completed dialog box opens.

10. Click **Close**.

The new SoundBanks have been generated and integrated into the Cube game. The next time you play Cube, the new sounds will be part of the game.

Known Issues

Because this is just an example of how to integrate the Wwise sound engine into a game engine, the following issues were not resolved in this release.

Known SDL Migration Issues

- Full-screen is not available.
- Gamma command is disabled.
- Cannot see server messages when running dedicated.
- Mouse cursor 'escapes' from game when frame rate is low.
- Mouse wheel weapon selection is broken.

Known Sound Issues

- There are no footstep sounds for occluded characters.
- Footsteps can be heard in the water.
- There is no interactive music.

Chapter 6. Need Help?

Using Help

Wwise Help contains detailed information on each interface element in Wwise.

To open Help from within Wwise, do one of the following:

- Click the Help icon (?) in the title bar of any of the views or dialog boxes.
- From the menu bar, click **Help > Wwise Help**.
- Press F1.

Additional Resources

The Cube game and its Wwise project provide an idea of the workflow of developing a full game with Wwise. If you want to learn more about Wwise by looking at different approaches to game audio implementation, we suggest you take a look at the following resources:

- **Limbo** - Available through the Audiokinetic Launcher along with its Wwise project, Limbo is the multi-award winning game developed by Playdead. Limbo might be best suited to more advanced Wwise users because it includes some complex sound hierarchies. Note, Limbo is not available to install from the Audiokinetic Launcher on a Mac.
- **Video Tutorials** - Video tutorials are available on the [Audiokinetic Video Channel](#) on our website and on [Audiokinetic's YouTube](#) channel.
- **Wwise Certification** - The [Wwise Certification](#) online courses offer several programs for learning Wwise fundamentals and advanced specialized topics. Note that the Wwise-101 and Wwise-201 Certification Programs use Cube as the platform of choice for teaching Wwise.
